Abstracts

A microprocessor is a kind of computer processor, which integrates the functions of a computer's central processing unit (CPU) on a single integrated circuit or at most a few integrated circuits. The microprocessor is a multi-purpose, programmable device that accepts digital data as input, processes according to instructions stored in memory, and outputs the results. It is an example of sequential digital logic, as it has internal memory. Microprocessors operate on numbers and symbols represented in the binary numeral system.
