Abstracts

Microturbines are generally small scale power generators that burn either gaseous or liquid fuel to produce electrical power. The burning of fuel creates high speed rotation of the turbine, which, in turn, rotates an electrical generator for power generation. These turbines are an essential part of distributed generation technology and are primarily used for on-site generation i.e. where the power generation and consumption happens mostly in the same place. These turbines also have great potential for CHP application, which increases their overall efficiency and provides numerous benefits to end-users.
