## Abstracts

Microturbines are generally small scale power generators that burn either gaseous or liquid fuel to produce electrical power. The burning of fuel creates high speed rotation of the turbine, which, in turn, rotates an electrical generator for power generation. These turbines are an essential part of distributed generation technology and are primarily used for on-site generation i.e. where the power generation and consumption happens mostly in the same place. These turbines also have great potential for CHP application, which increases their overall efficiency and provides numerous benefits to end-users. Based on the Microturbine Systems market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
