## Abstracts

A microturbine is a small scale power generating equipment that produce electrical power by burning either gaseous or liquid fuels. The combustion of these fuels in the turbine produces high speed rotation of the turbine shaft, which then turns an electrical generator for producing electrical power. Microturbines can work using an array of liquid and gaseous fuels including natural gas, biogas, sour gases, gasoline, diesel, kerosene, and heating oil.

Based on the Microturbines market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
