Abstracts

The military was quick to pick up on the potential for 3D printing, also known as additive manufacturing (AM), when it was first developed in the early 1980s. In an industry where parts have to fulfil any number of regulations and often be backwardly compatible for decades, it found its niche in prototyping, where a single solid object is worth a thousand computer models. 3D printing is any of various processes in which material is joined or solidified under computer control to create a three-dimensional object, with material being added together (such as liquid molecules or powder grains being fused together). 3D printing is used in both rapid prototyping and additive manufacturing. Objects can be of almost any shape or geometry and typically are produced using digital model data from a 3D model or another electronic data source such as an Additive Manufacturing File (AMF) file (usually in sequential layers). There are many different technologies, like stereolithography (SLA) or fused deposit modeling (FDM). Thus, unlike material removed from a stock in the conventional machining process, 3D printing or Additive Manufacturing builds a three-dimensional object from computer-aided design (CAD) model or AMF file, usually by successively adding material layer by layer.
