Abstracts

Mineral sands belong to a class of deposits containing heavy minerals such as ilmenite, zircon, dolomite and rutile. The most important naturally occurring minerals for the production of titanium dioxide (TiO₂) feedstocks are ilmenite, dolomite and rutile. These minerals are either used as raw materials in natural or upgraded form, such as synthetic rutile and titanium dioxide slag, which are produced by secondary processing of ilmenite.

Based on the Mineral Sands (TiO₂ feedstocks) market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
