Abstracts

Concentrated Solar Power (CSP), also known as Solar Thermal Energy (STE) is now routinely bid to include thermal energy storage (TES) which enables it to ship power on demand like a natural gas power plant, making thermal solar the “dispatchable” solar. Because of its inherent ability to store energy thermally, CSP is a dispatchable solar can be turned on whenever it is needed, at any time, day or night. CSP is a unique form of solar energy because it can serve as a baseload power source, just like a coal or natural gas combined-cycle power plant, generating electricity on a 24-hour cycle. CSP can also serve as a flexible source of electricity by providing electricity when needed; it can accompany photovoltaic or wind power, just like a natural gas simple-cycle power plant, to assist in power generation when the sun isn't shining or when winds are calm.

Concentrating Solar Power (CSP) technologies use mirrors to concentrate (focus) the sun's light energy and convert it into heat to create steam to drive a turbine that generates electrical power. The CSP consists of components configured in different systems, including parabolic troughs, linear Fresnel, power towers and dish engines.
