Abstracts

Concentrated Solar Power (CSP), also known as Solar Thermal Energy (STE) is now routinely bid to include thermal energy storage (TES) which enables it to ship power on demand like a natural gas power plant, making thermal solar the “dispatchable” solar. Because of its inherent ability to store energy thermally, CSP is a dispatchable solar can be turned on whenever it is needed, at any time, day or night. CSP is a unique form of solar energy because it can serve as a baseload power source, just like a coal or natural gas combined-cycle power plant, generating electricity on a 24-hour cycle. CSP can also serve as a flexible source of electricity by providing electricity when needed; it can accompany photovoltaic or wind power, just like a natural gas simple-cycle power plant, to assist in power generation when the sun isn't shining or when winds are calm.

Concentrating Solar Power (CSP) technologies use mirrors to concentrate (focus) the sun's light energy and convert it into heat to create steam to drive a turbine that generates electrical power. The CSP consists of components configured in different systems, including parabolic troughs, linear Fresnel, power towers and dish engines. Based on the Molten Salt Solar Energy Thermal Storage in CSP System market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
