## Abstracts

The principle of an mRNA vaccine is to deliver mRNA to a target cell where it will be translated into a coded antigen, allowing for immunological recognition and promising protection. By using genetic material to encode antigens, new vaccines can be quickly created or modified at a very low cost. Another advantage of RNA vaccines is that they can be stable for long periods of time at room temperature, allowing for use in rural areas where refrigeration costs are high or non-existent.

Based on the mRNA Vaccines and Therapeutics market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
