Abstracts

Butanol is an alcohol that is produced through petrochemical processes, but can also be produced, like ethanol, through fermentation of sugars derived from corn and agricultural crops. Butanol is a four carbon alcohol; ethanol is a two carbon alcohol. Ethanol is primarily sold as a fuel blend stock for gasoline. N-butanol is sold primarily as a chemical. It's worth noting there are two types of butanol: normal butanol (or n-butanol) and isobutanol. While the two molecules possess similar characteristics, they have dramatically different uses. N-butanol is a superior global chemical with over 8 billion pounds of annual demand. Isobutanol is primarily marketed as a fuel blend stock similar to ethanol today and correspondingly has a much lower value as a fuel. Based on the N-Butanol market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.

In chapters 8-13, we update the timely industry economic revitalization plan of the country-wise government.
