Abstracts

Paraffin wax is made from sludge waste left by crude oil when it is refined into gasoline. Paraffin wax can be colored, while true natural wax wax can't. In addition, many scented candles made of paraffin also contain heavy metals such as lead. Even a few hours of burning produce large amounts of heavy metals in the air that are considered harmful to children; low levels of exposure have been shown to cause high blood pressure, neurobehavioral changes and other problems. In addition, since many of these candles contain artificial flavors and dyes, they release other harmful chemicals.
