Abstracts

Navigation Suits are personal closed equipment that assure the astronauts' life activities and work capabilities. The hazards to the human body include environmental factors such as vacuum, high and low temperature, solar radiation, and micro-meteors that can protect the space. In a vacuum environment, the nitrogen contained in human blood turns into gas and expands the volume. If a person does not wear a gas-tight Navigation Suits, he or she will be at risk because of a great pressure difference between the inside and outside. Space suits are multi-functional garments developed on the basis of pilots' cloaks. The early Navigation Suits could only be used by astronauts in the cockpit of the spacecraft, and space suits for extravehicular use were developed. Modern modern Navigation Suits for space use have a liquid cooling structure that allows astronauts to embark on cabin activities or visit the moon.
