Abstracts

Coke is a byproduct of oil refining and coal gasification process and is used as a fuel to manufacture iron, steel and anodes for aluminum smelters. Higher quality ultra-high power (UHP) graphite electrodes and cathode electrodes to melt the scrap metal for recycling steel in the electric arc furnace (EAF) are manufactured from needle coke. For the production, of needle coke the separation of heavy fraction of aromatic feedstock is required to be done in fractionation unit. The thick fraction is then fed to coker unit to attain coking temperatures (3000°C). The furnace operation is critical since it has to 'delay' the feed to attain desired temperature. This minimizes the coke formation in the furnace. Thus, the effective extraction of needle coke is done in this step which is similar to delayed coking.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Needle Coke market covering all its essential aspects.
