Abstracts

Neural stem cells (NSCs) are the self-renewing, multipotent cells that differentiate into the main phenotypes of the nervous system. These cell types include neurons, astrocytes, and oligodendrocytes. Neural progenitor cells (NPCs) are the progeny of stem cell division that normally undergo a limited number of replication cycles in vivo. Researchers have isolated NSCs, which have demonstrated pluripotency and the ability to differentiate into many different immune system cell types.
