Abstracts

Nuclear Medicines are primarily drugs that contain radioactive elements for radionuclide-emitting ionizing radiations. Their core application lies in the diagnosis and treatment of various diseases that conventional medicines fail to achieve. Radiopharmaceuticals are unique as they are used to directly target specific organs sites in the body where the drug can emit radiations. These radiations are then captured by gamma cameras placed in proximity of the patient. The radiation dose in these pharmaceuticals is kept as low as possible to avoid the side effects of radiation exposure.

Based on the Nuclear Medicine-Radiopharmaceuticals market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
