Abstracts

Online water quality monitoring system is a set of equipment and software system that automatically analysis the monitored water quality. And transmit the data information to the information management center or actuator equipment and software system of the actuator.

Online water quality monitoring is normally performed by using online instruments for measurement of water quality in source waters and distribution systems. Water quality monitoring is nothing but collecting of information at pre-defined locations and regular intervals, so as to make data available for use in order to explain the existing conditions. The model that has been developed is mainly for the purpose of conducting a test for water samples and subsequently upload the data over the internet for analysis. This process of water quality monitoring is performed in order to measure the water quality parameters by checking for any microbial, physical and chemical properties and checking for any deviations in the parameters laid down which can help to signal a warning in the event of hazards.
