Abstracts

An optical coating is composed of a combination of thin film layers that create interference effects used to enhance transmission or reflection properties within an optical system. The performance of an optical coating is dependent upon the number of layers, the thickness of the individual layers, and the refractive index difference at the layer interfaces. Many common types of coatings are used on precision optics, including Anti-Reflection (AR) Coatings, High Reflective (Mirror) Coatings, Beamsplitter coatings, and Filter coatings such as shortpass, longpass, and notch filters. Anti-reflection coatings are included on most refractive optics and are used to maximize throughput and reduce unwanted reflections. High Reflective coatings are designed to maximize reflectance at either a single wavelength or across a broad range of wavelengths and are most often used to create mirrors. Beamsplitter coatings are used to divide incident light into known transmitted and reflected light outputs.

Based on the Optical Coatings market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
