## Abstracts

Orthopedic bone cements can be defined as biomaterials obtained by mixing a powder phase and a liquid phase, which can be molded and implanted as a paste and have the ability to set once implanted within the body. They are widely used in different applications of orthopedic surgery. Orthopedic bone cement is being used for in arthroplasty procedures for over four decades for the purpose of total joint replacement prosthesis to periprosthetic bone. Orthopedic bone cement helps support and anchor artificial joints and fractured bones. It works by filling the empty space between the bone and an implant, which anchors the joint. This in turn provides stability and elasticity to the joints. All in all, orthopedic bone cement helps to support and strengthen prosthetic joints and broken bones. The growing number of orthopedic surgeries in the world is expected to increase the demand for cement.
