## Abstracts

An oxygen sensor is an electronic device that measures the proportion of oxygen, in the gas or liquid being analyzed. The most common application is to measure the exhaust-gas concentration of oxygen for internal combustion engines, in automobiles and other vehicles, in order to calculate and, if required, dynamically adjust the air-fuel ratio, so that catalytic converters can work optimally.

Oxygen sensor is not only used in automobile engines, it is also widely used in the gas composition control of various types of coal combustion, oil combustion, gas combustion and other furnace, it is currently the best combustion gas composition measurement method, with simple structure, rapid response, easy maintenance, easy to use, accurate measurement and other advantages. The use of the sensor for combustion gas composition measurement and control can not only stabilize and improve product quality, but also shorten the production cycle and save energy.
