Abstracts

PP and its alloys have become the plastic of choice in the automobile market where it can provide substantial weight savings. It is used in internal and external body panels and its heat resistance makes it suitable for use for components in the engine compartment. PP's low density, combined with good mechanical properties (especially when filled or compounded) and good injection moulding characteristics, make it very suitable for the large-volume, weight-conscious automotive market. Over a third of plastics in automobiles are PP and PP alloys.

Based on the PA-PP Alloy market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
