Abstracts

Patch pumps are the convergence of several technologies into a single drug delivery device package. In doing so, this class of devices overcomes a number of shortcomings and limitations, while simplifying the drug administration event at the patient interface. Patch Pump Drug Delivery System do not have tubing, it is worn like a patch. Insulin pump, such as Tandem slim X2TM and Animas® (Johnson & Johnson) insulin pump do not classified as a patch pump. Patch pumps have been around for years delivering insulin to diabetes patients with the promise of improving quality of life in managing their disease, but a number of devices have been designed and are being developed to be - within the limits of drug pharmacology - essentially API agnostic. There are however other drugs with treatment regimes that could benefit from the ease of use of a body worn patch pump and it looks like that is starting to happen.
