## Abstracts

Perfluoroalkoxy (PFA) are fluoropolymers. They are copolymers of tetrafluoroethylene (C<sub>2</sub>F<sub>4</sub>) and perfluoroethers (C<sub>2</sub>F<sub>3</sub>OR<sub>f</sub>, where R<sub>f</sub> is a perfluorinated group such as trifluoromethyl (CF<sub>3</sub>)). In terms of their properties, these polymers are similar to polytetrafluoroethylene (PTFE). The big difference is that the alkoxy substituents allow the polymer to be melt-processed. On a molecular level, PFA has a smaller chain length and higher chain entanglement than other fluoropolymers. It also contains an oxygen atom at the branches. This results in a material that is more translucent and has improved flow, creep resistance, and thermal stability close to or exceeding PTFE. Similarly advantaged processing properties are found in fluorinated ethylene propylene (FEP), the copolymer of tetrafluoroethylene and hexafluoropropylene.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Perfluoroalkoxy (PFA) market covering all its essential aspects.
