## Abstracts

Coke is a byproduct of oil refining and coal gasification process and is used as a fuel to manufacture iron, steel and anodes for aluminum smelters. Higher quality ultra-high power (UHP) Aluminums and cathode electrodes to melt the scrap metal for recycling steel in the electric arc furnace (EAF) are manufactured from needle coke. For the production, of needle coke the separation of heavy fraction of aromatic feedstock is required to be done in fractionation unit. The thick fraction is then fed to coker unit to attain coking temperatures (3000°C). The furnace operation is critical since it has to 'delay' the feed to attain desired temperature. This minimizes the coke formation in the furnace. Thus, the effective extraction of needle coke is done in this step which is similar to delayed coking.

Based on the Petroleum Needle Coke market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
