## Abstracts

Phages, formally known as bacteriophages, are viruses that solely kill and selectively target bacteria. They are one of the most common biological entities that can effectively fight and destroy multi-drug resistant bacteria. When all antibiotics fail to work against an infection, the phages are able to kill the bacteria causing infections, thus helping the medical professionals in saving a life. Bacteriophages are being considered as a new alternative to antibiotics. In this therapy, the viruses are used to inject their genetic material into bacteria and use their host machinery to multiply themselves. This phage therapy is used to treat or to prevent bacterial infections in patients' body.

Bacteriophage therapy also plays a significant role in research fields of molecular biology and biotechnology. These factors enhance the potential scope for drug discovery. Phage has many potential applications in human medicine as well as veterinary science, and agriculture. Phage therapy, viral phage therapy, or phagotherapy is the therapeutic use of bacteriophages for the treatment of pathogenic bacterial infections.
