## Abstracts

A photolithography system is essentially a projection system, and light is projected through a blueprint of the pattern that will be printed. Photolithography equipment refers to the process of transferring geometric patterns to a film and substrate in microfabrication. It relies on a single beam of ultraviolet light to etch a pattern into integrated circuits. As it assists in producing extremely small incisions while being highly efficient and cost-effective, it is widely used to produce semiconductor product and control the exact size and shape of a substrate. Photolithography equipment can be classified according to the type of light used, such as ultraviolet, extreme ultraviolet and so on.
