## Abstracts

Plasma nitriding uses nitrogen and hydrogen as nitriding gases, and glow discharge is obtained by applying a DC voltage of several hundred volts between the product and the furnace wall of the nitriding furnace in a vacuum atmosphere of 13.3Pa to 1.3kPa. is processed by Products are nitrided using the impact of nitrogen ions and hydrogen ions obtained by glow discharge on the product surface. In plasma nitriding, ion bombardment simultaneously cleans, heats, and nitrates the nitrided surface. Plasma nitriding offers a high degree of freedom in selecting the optimal nitriding conditions for each product material and application, and because it can harden without oxidation, it is widely used for molds and precision machinery parts. Plasma nitriding has a remarkable nitriding effect on nodular cast iron, alloy steel, stainless steel, powder metallurgy products, titanium alloys, high speed steel, tool steel, etc. The main advantages of plasma nitriding compared to conventional nitriding process are: shorter cycle time, controlled growth of surface layer, elimination of white layer, less distortion, no finishing required, pore-free surface, mechanical mask replacing copper plating, etc. is. Plasma nitriding furnace is the main equipment for performing plasma nitriding.
