Abstracts

The most popular nail gun is a pneumatic nail gun. In these machines, the hammering force comes from compressed air, usually produced by a separate pneumatic air compressor. The working principle of a standard air compressor is the same as that of a water pump. It has one or more piston cylinders, which take in air from the atmosphere during the upstroke and push it out to the spray gun during the downstroke. This creates a continuous supply of compressed air, which flows through the hose into the air tank of the spray gun.

The pneumatic nail gun uses the same hammer as the electromagnetic nail gun: it has a sliding piston to drive the long blade. When the air pressure above the piston head is greater than the air pressure below it, the piston is forced downward. When the air pressure below the piston is greater than the air pressure above it, the piston will remain upward. The trigger mechanism is used to direct the flow of compressed air to change this balance.
