Abstracts

Point-of-care testing (POCT) may be defined as the rapid specific testing of bodily fluids at the bedside.

Owing to the relatively long turnaround time of conventional laboratory tests, and with the aim of reducing inappropriate transfusion, there is increasing interest in point-of-care coagulation testing (POCCT) which can provide results within minutes. In addition, the wide acceptance of the current cell-based model of coagulation has led to an emphasis on the pivotal role of platelets and particular interest in devices testing whole blood, rather than plasma used in laboratory-based tests. The latter include the prothrombin time (PT) and activated partial thromboplastin time (aPTT) which provide information on the first phase of coagulation up to fibrin formation. Conversely, viscoelastic POCCT devices produce information on all phases of coagulation, providing insight into interactions between the cellular and plasma components of whole blood and the activity of the fibrinolytic system; all of which are vital for successful haemostasis.
