## **Abstracts**

Polydimethylsiloxane (PDMS) is the simplest member of the silicone polymer family. It is formed by hydrolyzing  $\text{Me}_2\text{SiCl}_2$ , which is produced from high-purity  $\text{SiO}_2$  and  $\text{CH}_2\text{Cl}_2$  by the Muller–Rochow reaction. The term “silicone” was coined by chemist F. S. Kipping in 1901.

Low–molecular weight PDMS is a liquid used in lubricants, antifoaming agents, and hydraulic fluids. Its use in breast implants is not as popular as it once was because of safety concerns.

At higher molecular weights, PDMS is a soft, compliant rubber or resin. It is used in caulks, sealants, an even Silly Putty. More recently, PDMS resins have been used in soft lithography, a key process in biomedical microelectromechanical systems (bio-MEMS).

Based on the Polydimethylsiloxane (PDMS) market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
