Abstracts

The polyether modified trisiloxane is a silicone surfactant, and its methyl group is adsorbed on the air-water interface by a unique "umbrella" structure, and the transfer surface tension is shifted by about 20 mN / m. Titanium dioxide can reduce the interfacial tension at the oil-water interface, while also expanding on the hydrophobic surface. This ability is called "super-transformation".

Based on the Polyether Modified Trisiloxane market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
