Abstracts

Membrane is a material with selective separation function. The process of separation, purification and concentration of different components of feed liquid by selective separation of membrane is called membrane separation. The difference between membrane separation and traditional filtration is that the membrane can be separated in the molecular range, and this process is a physical process without phase change and additives. The gas membrane separation technology refers to the process of separating the components of the gas mixture with different permeation rates in the gas separation membrane under the effect of pressure difference. Gas membrane separation technology has the advantages of high separation efficiency, low energy consumption, simple operation, easy control, no secondary pollution, wide application range, etc. It can be used in gas separation, gas purification, gas filtration, etc. It can be widely used in electronics, petrochemical, metallurgy, medicine, food, environmental protection and other industries.
