Abstracts

Positron emission tomography is used to study the activity of cells in humans. It provides information about biological activities in the human body in a non-invasive manner. Positron emission tomography produces an image of the body by detecting radiation emitted by radioactive material injected into the body. These materials are usually radioactive atoms such as carbon-11, fluorine-18, oxygen-15 or nitrogen-13. Based on the Positron Emission Tomography (PET) Scanners market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
