## Abstracts

The power factor refers to the relationship between the effective power and the total power consumption (apparent power), that is, the ratio of the effective power divided by the total power consumption (apparent power). Basically, the power factor can measure the degree to which power is effectively utilized. When the power factor value is larger, it represents the higher the power utilization rate. The phase difference between the current and the voltage causes a loss of switching power, and the PFC circuit is required to increase the power factor.
