## Abstracts

Film capacitors use a thin plastic film as the dielectric. The film of the capacitor is made very thin, usually through a complex film drawing process, with a thickness of less than 1  $\mu$ m. Once manufactured, the film is either metallized or left untreated depending on the application. The structure is further completed by the addition of electrodes, after which the entire assembly is mounted into the housing to prevent certain environmental factors. Film capacitors are not polarized and are therefore highly preferred for use in AC signals and power supplies.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Power Film Capacitors market covering all its essential aspects.
