## Abstracts

Film capacitors use a thin plastic film as the dielectric. The film of the capacitor is made very thin, usually through a complex film drawing process, with a thickness of less than 1  $\mu$ m. Once manufactured, the film is either metallized or left untreated depending on the application. The structure is further completed by the addition of electrodes, after which the entire assembly is mounted into the housing to prevent certain environmental factors. Film capacitors are not polarized and are therefore highly preferred for use in AC signals and power supplies.

Based on the Power Film Capacitors market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
