## **Abstracts**

Power resistors are designed to withstand and dissipate large amounts of power. Typically, they are rated for at least 5 watts. They are made of a material with high thermal conductivity and can be effectively cooled. They are usually designed to couple with a heat sink to dissipate a lot of power. At maximum load, some may even require forced air or liquid cooling. Some are wound and some are made of wire grids to facilitate cooling, but all power resistors have in common that they are constructed to dissipate maximum power while keeping their size as small as possible.

The Power Resistors market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
