Abstracts

Power resistors are designed to withstand and dissipate large amounts of power. Typically, they are rated for at least 5 watts. They are made of a material with high thermal conductivity and can be effectively cooled. They are usually designed to couple with a heat sink to dissipate a lot of power. At maximum load, some may even require forced air or liquid cooling. Some are wound and some are made of wire grids to facilitate cooling, but all power resistors have in common that they are constructed to dissipate maximum power while keeping their size as small as possible.

Based on the Power Resistors market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
