Abstracts

A burner is a device that controls the mixing of air with a combustible fuel to produce a stable flame pattern. In the report, we focus on burners used in the petroleum and chemical industries.

The flare system collects and vents gases from atmospheric or pressurized process components to the atmosphere for safe placement under normal operating and abnormal conditions. The flare system consists of a torch chimney and a pipe that supplies gas to the chimney. The type and amount of gas or liquid in the torch stack determines the size and brightness of the torch.

Thermal oxidants reduce air pollution emissions in a variety of industrial processes. Using the 'thermal oxidation' principle, contaminants in contaminated exhaust gases react with oxygen in a temperature controlled environment during combustion. The chemical oxidation reaction destroys the pollutants in the polluted exhaust gas and then discharges it back into the atmosphere. The release of harmless carbon dioxide, water vapor and heat.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Process Burners, Process Flares & Thermal Oxidizer Systems market covering all its essential aspects.
