Abstracts

The airflow containing wood chips is sent to the diversion bin of the bag filter through the fan, and the flow rate is reduced under the action of the baffle. The heavier wood particles fall into the ash bin under the action of gravity, and other lighter and finer dust Adsorbed on the outer surface of the filter bag with the airflow, after passing through the bag, the clean gas enters the exhaust chamber and is discharged to the outside. As the filtration conditions continue, more and more dust will accumulate on the outer surface of the filter bag, which will increase the running resistance of the system and reduce the dust removal efficiency of the system. After the pulse amplitude and frequency setting is completed, the system will automatically complete the cleaning of the filter bag during the working process, thereby greatly increasing the similar filtering efficiency and prolonging the service life of the filter bag.
