Abstracts

PVC pipes are made up of a plastic resin chemically known as- polyvinyl chloride (PVC), which is the third largest synthetic polymer produced in the world. They are manufactured by the extrusion of a blend of polymer resin (PVC) and various additives. Plasticizers may or may not be added in this mix to impart rigidity or flexibility to the pipe. This blend after heating when forced into a die results in the rigid/flexible PVC pipe coming out. It is then sized, cooled, hauled off and cut in the desired length. Compared to concrete pipes, the manufacturing of PVC pipes requires around four times lesser energy and incurs lower losses of the raw material PVC. The complete recyclability of PVC also makes their environmental footprint far smaller than competing piping materials.

Based on the PVC pipes market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
