Abstracts

PVC stabilizers prevent the initial elimination of hydrogen chloride in PVC. Since PVC is softened by heating during extrusion or molding, it is necessary to prevent the elimination of hydrogen chloride due to heating and subsequent decomposition. When the PVC is heated to 170-180 ° C, chlorine and hydrogen in the molecule are eliminated, and the release of hydrogen chloride becomes apparent. Once this decomposition begins, an unstable structure is formed in the molecule, which further accelerates the elimination and decomposition of HCl.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the PVC Stabilizer market covering all its essential aspects.
