Abstracts

PVC stabilizers prevent the initial elimination of hydrogen chloride in PVC. Since PVC is softened by heating during extrusion or molding, it is necessary to prevent the elimination of hydrogen chloride due to heating and subsequent decomposition. When the PVC is heated to 170-180 ° C, chlorine and hydrogen in the molecule are eliminated, and the release of hydrogen chloride becomes apparent. Once this decomposition begins, an unstable structure is formed in the molecule, which further accelerates the elimination and decomposition of HCl.

The PVC Stabilizer market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
