## Abstracts

PVC stabilizers prevent the initial elimination of hydrogen chloride in PVC. Since PVC is softened by heating during extrusion or molding, it is necessary to prevent the elimination of hydrogen chloride due to heating and subsequent decomposition. When the PVC is heated to 170-180 ° C, chlorine and hydrogen in the molecule are eliminated, and the release of hydrogen chloride becomes apparent. Once this decomposition begins, an unstable structure is formed in the molecule, which further accelerates the elimination and decomposition of HCl.

Based on the PVC Stabilizer market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
