Abstracts

The radar is mainly composed of an antenna, a transmitter, and a receiver, including a signal processor and a display. The radar transmitter generates enough electromagnetic energy to be transmitted to the antenna through the transceiver switch. The antenna radiates these electromagnetic energy into the atmosphere and concentrates in a very narrow direction to form a beam that propagates forward. After the electromagnetic wave encounters the target in the beam, a part of the electromagnetic energy that reflects in various directions is reflected back to the radar and is acquired by the radar antenna. The energy acquired by the antenna is sent to the receiver through the transceiver switch to form an echo signal of the radar.
