Abstracts

Rebreathers is a breathing apparatus that absorbs carbon dioxide from the user's exhaled breath to allow unused basic rebreathing (recycling) oxygen content, and unused inert content when present, each breath. Oxygen is added to supplement the amount of metabolism of the user. This is in contrast to open circuit breathing devices in which exhaled gases are discharged directly into the environment.

Respirator technology can be used where breathing gas supplies are limited, such as underwater or space, environmentally toxic or anoxic, such as firefighting, mine rescue and aerial work, or breathing gas is particularly rich or contains expensive components such as thinners Or anesthetic gas.
