Abstracts

Reverse osmosis (RO) refers to a technology that deionizes or purifies water by pushing it through a semi-permeable membrane under high pressure. The RO membrane is a thin layer of filtering material that separates contaminating agents and dissolved salts from drinking water. It consists of three layers, namely a polyester support web, a microporous polysulfone interlayer and an ultra-thin polyamide barrier layer. These membranes can be used in both industrial processes and for obtaining potable water. Nowadays, they are increasingly being used across the globe for water purification, as the RO process offers an environment-friendly and cost-effective alternative to the conventionally used techniques such as distillation and evaporation.
