Abstracts

Scale-out NAS is an advanced structure to enhance the storage capacity. In order to do that it increases and boosts the total capacity of disk spaces. Scale-out network attached storage (NAS) is being implemented to the storage capacity by adding and configuring scale-out NAS automatically whenever required. It increases the network capacity of the devices and when scale-out system reaches to its limit, it automatically allows another added array to expand system capacity. Architecture of scale out NAS includes a single added cluster. Each devices (node) have individual storage capacity which may be in the form of spindles, own processing power and I/O (input /output) bandwidth, resulting in increased storage capacity, thereby increasing the performance.
