## Abstracts

A seaplane is an aircraft that can take off, land, and park on the water. When the seaplane is moored on the water, the buoyancy generated by the large hull will cause the aircraft to float on the water and will not sink. But when it is necessary to take off, the pulling force generated by the propeller engine will drag it to run on the water at a fairly fast speed. With the increasing speed, the lift generated on the wing gradually overcomes the gravity of the aircraft, thus gradually lifting the aircraft from the water surface and becoming a ship flying in the air.

The Seaplanes market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
