## Abstracts

A seaplane is an aircraft that can take off, land, and park on the water. When the seaplane is moored on the water, the buoyancy generated by the large hull will cause the aircraft to float on the water and will not sink. But when it is necessary to take off, the pulling force generated by the propeller engine will drag it to run on the water at a fairly fast speed. With the increasing speed, the lift generated on the wing gradually overcomes the gravity of the aircraft, thus gradually lifting the aircraft from the water surface and becoming a ship flying in the air.

Based on the Seaplanes market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
