Abstracts

Security testing is a process designed to reveal deficiencies in information system security mechanisms that protect data and maintain functionality as expected. Due to the logical limitations of security testing, passing a security test does not mean that there are no defects or that the system adequately meets the security requirements. Typical security requirements may include specific elements of confidentiality, integrity, authentication, availability, authorization, and non-repudiation.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Security Testing market covering all its essential aspects.
